## 4D Modeling

- The need
  - Traditional design and construction planning tools, such as 2D drawings and network diagrams, do not support the timely and integrated decision making necessary to move projects forward quickly.
  - They do not provide the information modeling, visualization, and analysis environment necessary to support the rapid and integrated design and construction of facilities.

## 4D Modeling

- Synthesis of construction schedules from design descriptions and integrated evaluation of design and schedule alternatives are still mainly manual tasks.
- Furthermore, the underlying representations of a design and a construction schedule are too abstract to allow the multiple stakeholders to visualize and understand the cross-disciplinary of design and construction decisions.

*Construction Management, 3/E* by Daniel W. Halpin

## 4D Modeling

- 4D modeling technologies are now being used by
  - Planners
  - Designers, and
  - Engineersto analyze and visualize many aspects of a construction project, from 3D design of the project to the sequence of construction to the relationships among schedule, cost, and resource availability data.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## 4D Modeling

- These intelligent 4D models support computer-based analysis of schedules with respect to cost, interference, safety, etc., and improve communication of design and schedule information.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## The Technology

- Extending the traditional planning tools, visual 4D models combine 3D CAD models with construction activities to display the progression of construction over time.
- However, 4D models are time –consuming to generate manually and cannot currently support analysis program.
- The difficulty and cost of creating and using such models are currently blocking their widespread adoption.

## Introduction

- As noted in the previous chapter, time planning is among the most important aspects of successful project management.
- The concept of project scheduling addresses the issues associated with time planning and management.
- Early scheduling methods used simple bar charts or Gantt charts to achieve a very simple and straightforward representation of time and work activity sequencing.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Introduction

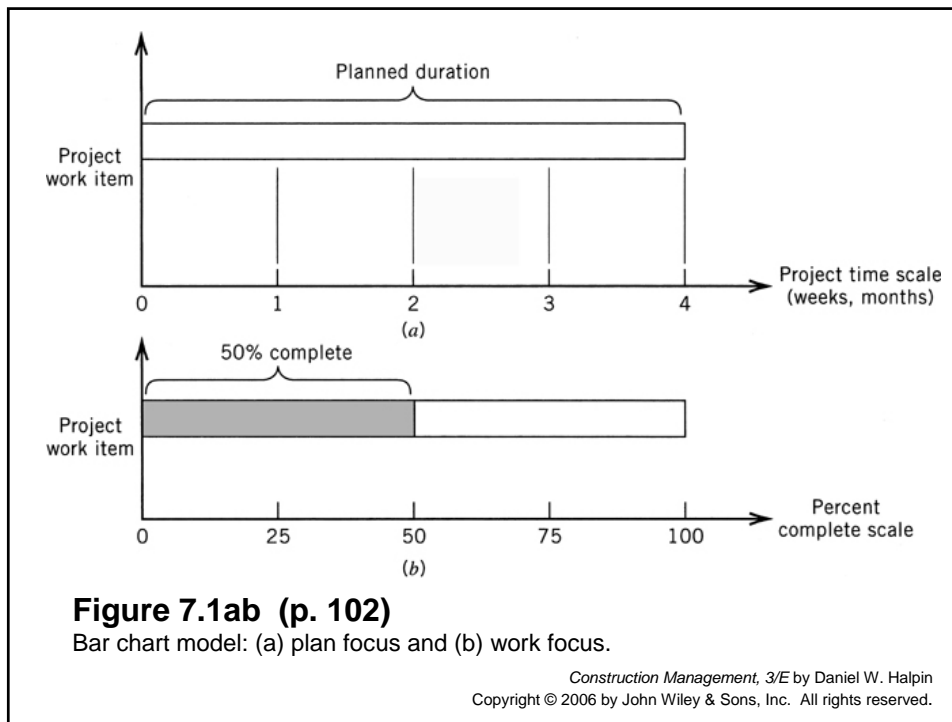

- During the past 40 years network based scheduling methods have become the norm, and many contracts require the use of network based schedules to reflect project progress to owner/client.
- Simply bar charting concepts as well as network scheduling concepts will be introduced in this chapter.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Bar Charts

- The basic modeling concept of the bar chart is the representation of a project work item or activity as a time scaled bar whose length represents the planned duration of the activity.
- The following figure shows a bar representation for a work item requiring four project time units (e.g., weeks).

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Bar Charts

- The bar is located on a time line to indicate the schedule for planned start, execution, and completion of the work activity.
- In practice the scaled length of the bar is also used as a graphical base on which to plot actual performance toward completion of the project work item as seen in the previous figure Part b.

## Bar Charts

- In this way the bar chart acts both as planning-scheduling model and as a reporting-control model.
- In this use of the bar chart, the length of the bar has two different meanings:
  1. The physical length of the bar represents the planned duration of the work item.
  2. It also provides a proportionally scaled baseline on which to plot at successive intervals of time, the correct percentage complete.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

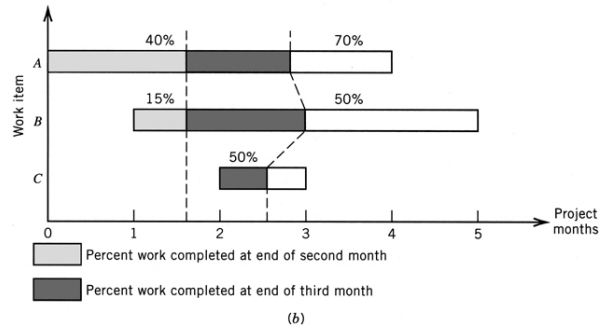

## Bar Charts

- The same figure (part b) shows a bar for a project work item that has been half completed.
- In a situation where the work rate is constant and field conditions permit, this would occur in half the planned duration.
- The following figure (part a) shows a schedule for a project consisting of three activities.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

**Figure 7.2 (p. 103)**

Bar chart project models:  
(a) bar chart schedule  
(plan focus) and (b) bar chart  
updating (control  
focus).

*Construction Management, 3/E* by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Bar Charts

- Activity A is to be carried out in the first four months.
- Activity B in the last four month.
- Activity C in the third month.
- Actual progress in the project can be plotted from time to time on these bars as shown in the same figure (part b)

*Construction Management, 3/E* by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Bar Charts

- In this manner, project status contours can be superimposed on the bar chart as an aid to manage control of the project.
- By using different shading patterns, the chart can indicate monthly progress toward physical completion of the activities.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Bar Charts

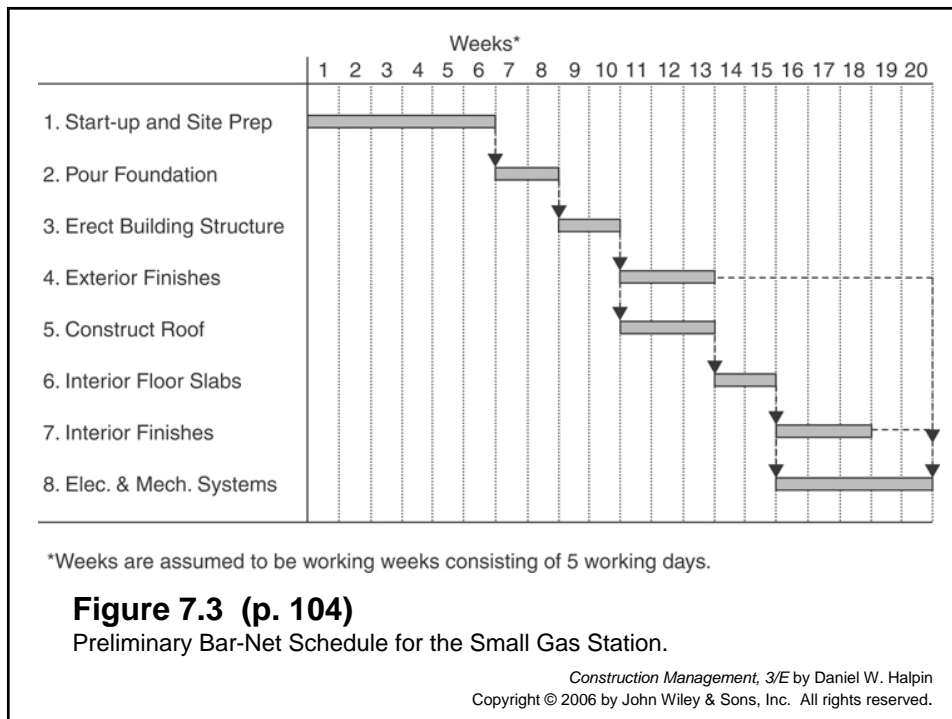

- Disadvantages
  - One disadvantage of the traditional bar chart is the lack of precision in establishing the exact sequence between activities.
  - This problem can be addressed by using directional links or arrows connecting the bars to give a precise indication of logical order between activities.
  - This connected diagram of bars is called a bar-net.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

# Bar Charts

- A bar-net showing the major activities defined in the preliminary project breakdown diagram for the small gas station of Chapter 6 is shown in the following figure of the next slide.
- The bar positioned in sequence against a time line.
- The sequence or logic between the bars is formalized by connecting the end of the preceding bar to the start of the following bar.

*Construction Management, 3/E* by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Bar Charts

- For instance, the end of bar 3.
- Erect Building Structure is connected using a directional link or arrow to the two activities that follow it (Activities 5 and 4).
- The use of directional arrows to connect preceding and following activities leads to the development of a preliminary scheduling document called a bar-net.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Bar Charts

- This is a schedule that combines the graphical modeling features of the bar (e.g., length to indicate duration, and scaling to a time line) with the sequencing features or directional arrows.
- Positioning the eight activities as bars in their logical sequence using the arrow connectors against a time line plotted in weeks allows us to visually determine that the duration of the entire project is roughly 20 weeks.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Bar Charts

- This bar-net diagram also allows one to determine the expected progress on the project as of any given week.
- For example, as of week 11, activities 1, 2, & 3 should be completed. Activities 4 and 5 should be in progress.
- If we assume a linear rate of production (i.e., half of a two week activity is completed after one week), we could assume that 1/3 of 4 and 5 will be completed as of the end of week 11.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Bar Charts

- A bar-net is somewhat more sophisticated version of a bar chart which emphasize the sequencing of activities by using arrow connectors.
- Use of this arrow connection approach to show logical order will be a key element of developing network schedules to be discussed later.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Scheduling Logic

- In developing schedule for a project, the logical or scheduling logic which relates the various activities to one another must be developed.
- In order to gain better understanding of the role played by sequencing in developing a schedule, consider, a simple pier made up of two lines of piles with connecting headers and simply supported deck slabs.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Scheduling Logic

- A schematic view of a portion of the pier is shown in the following figure of next slide.
- The various physical components of the pier have been identified and labeled.
- An exploded view of the pier is shown in the figure in part b, which shows each physical component individually separated but in the same relative position.

Construction Management, 3/E by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

**Figure 7.4 (p. 105)**

Simple schematic models.  
(a) Schematic view of pier.  
(b) Exploded view of pier.  
(Antill and Woodhead, 1982).

*Construction Management, 3/E* by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Scheduling Logic

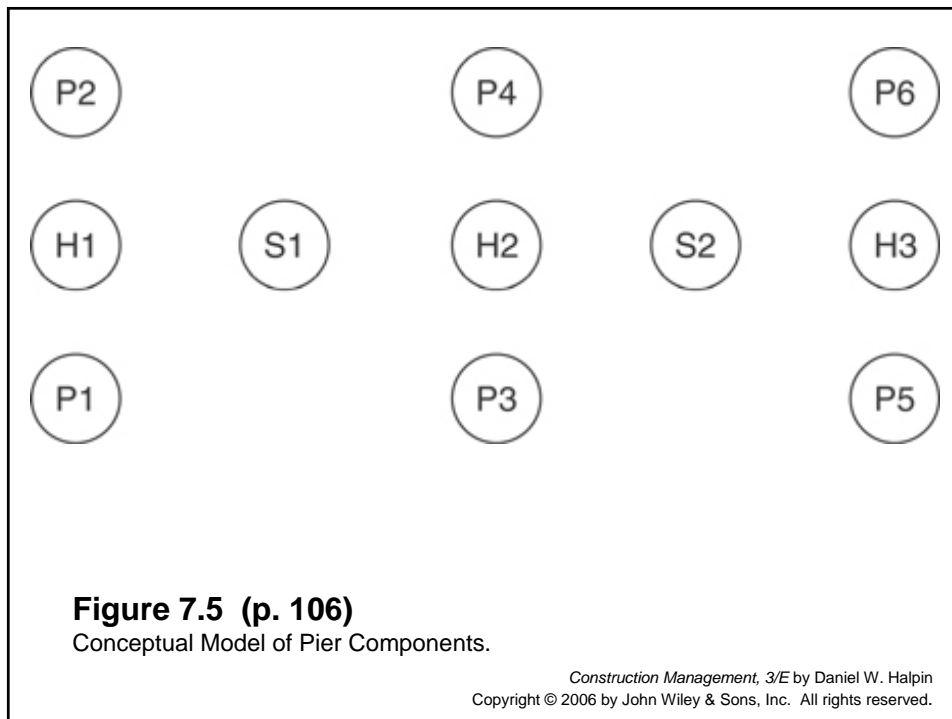

- Notice that abbreviated labels have now been introduced.
- Clearly, these figures are schematic models (i.e., not physical models), but they have rather simple conceptual rules so that physical relationship between components of the structure is clear.

*Construction Management, 3/E* by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

## Scheduling Logic

- Now suppose that each component or element is represented by a labeled circle (or node). The following figure in the next slide gives a “plan” view of the pier components shown in the previous figure.
- Such an abstraction or model can be used as the basis for portraying information about physical makeup of the pier or about the order in which the physical components will actually appear on the site.

*Construction Management, 3/E by Daniel W. Halpin*

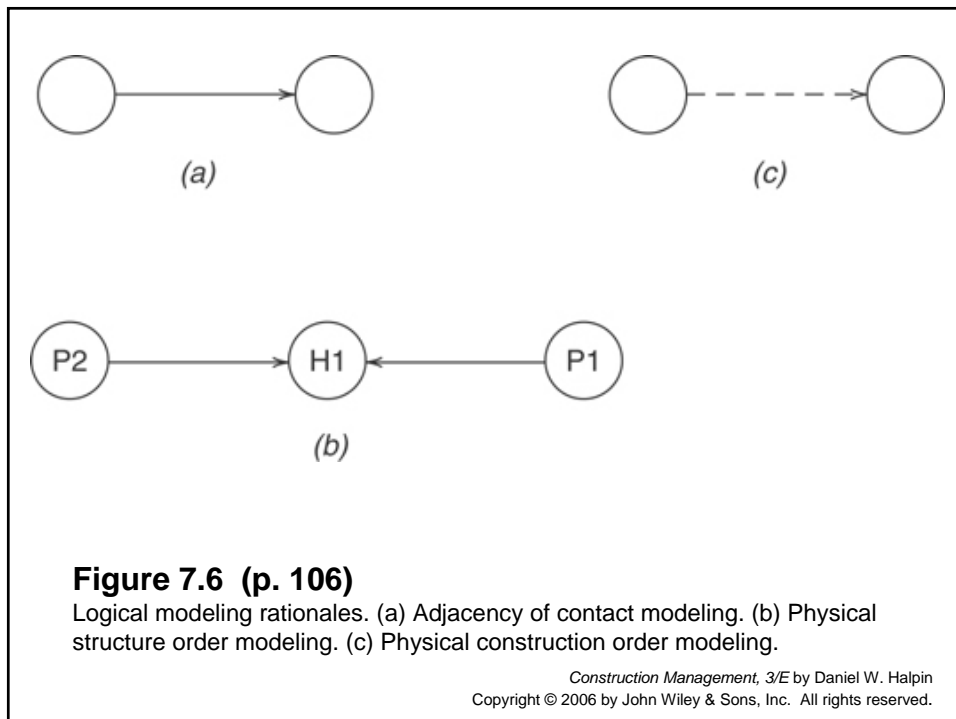

**Figure 7.5 (p. 106)**  
Conceptual Model of Pier Components.

*Construction Management, 3/E by Daniel W. Halpin*  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

# Scheduling Logic

- For example, an indication of the adjacency of physical components or relational contact of physical components may be required.
- A model to portray these properties requires a modeling element (say a line) to indicate that property exists.
- Assuming the modeling rationale of the following figure (a), the various nodes of the previous figure can be joined by a series of lines to develop a graph structure portraying the physical component adjacency or contact nature of the pier.

*Construction Management, 3/E* by Daniel W. Halpin  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

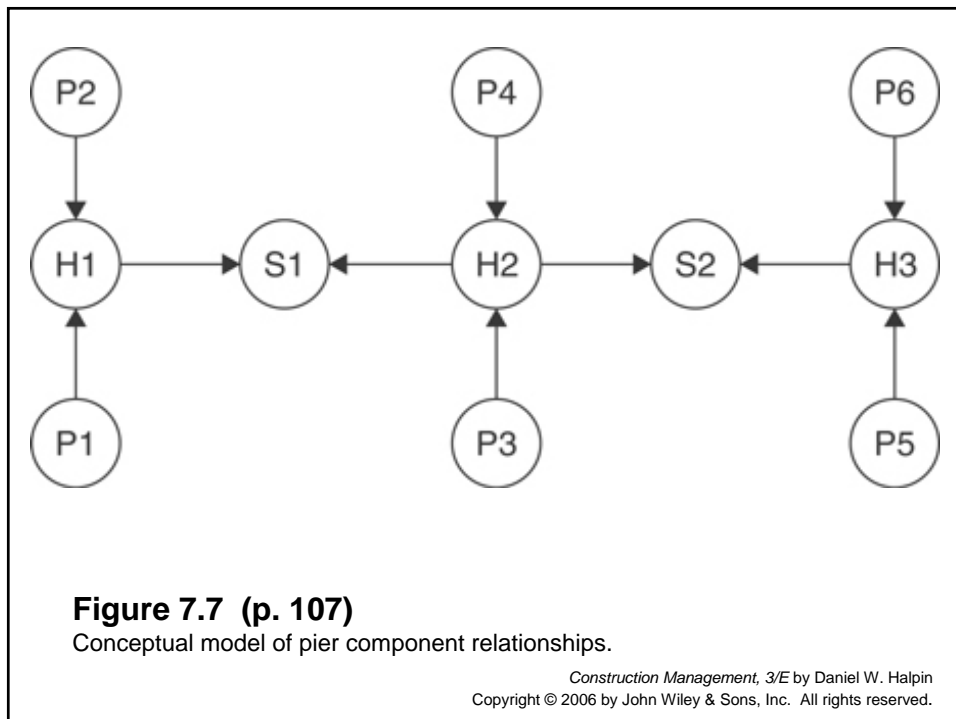

## Scheduling Logic

- If the idea of contact is expanded to indicate the order in which elements appear and physical contact is established, a directed modeling rationale may be used, as shown in the figure in part b.
- Using this conceptual modeling rule, The following figure of the next slide can be developed.

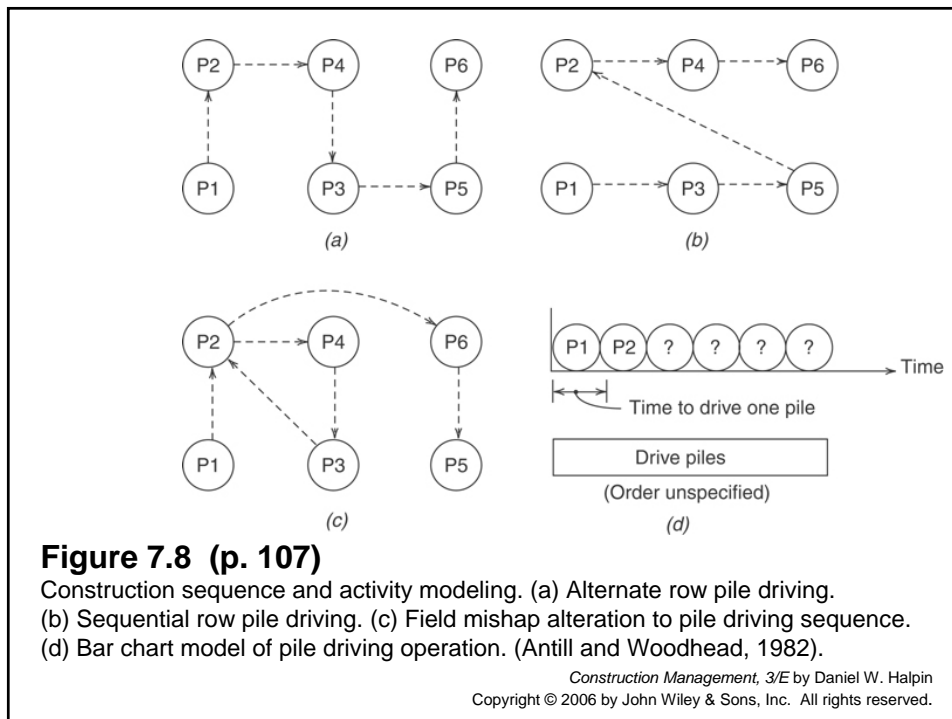

*Construction Management, 3/E by Daniel W. Halpin*  
Copyright © 2006 by John Wiley & Sons, Inc. All rights reserved.

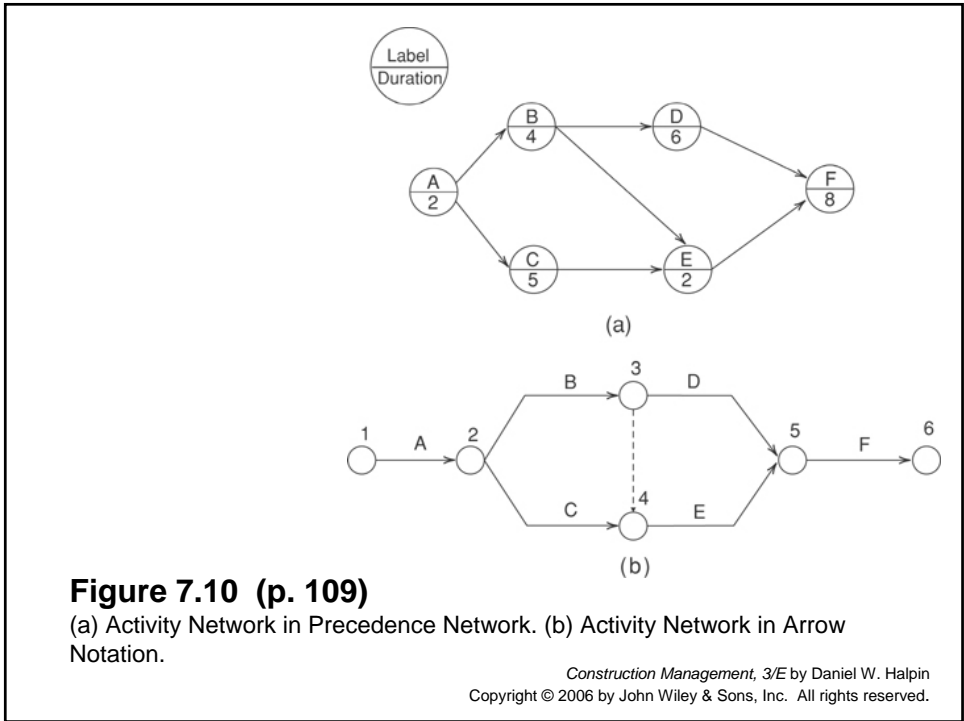

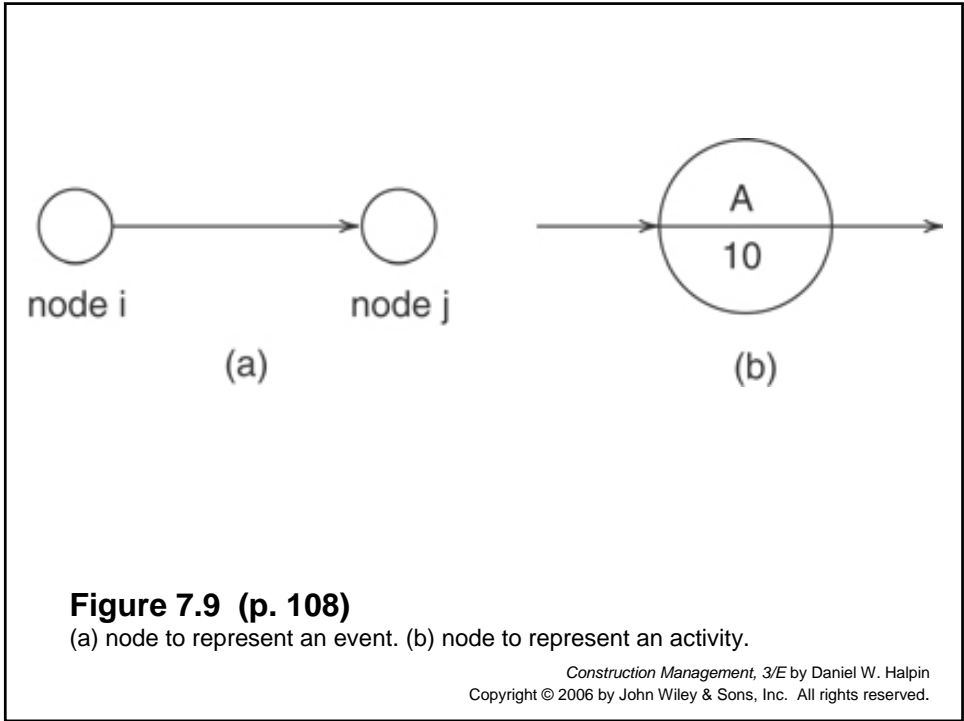

# Scheduling Logic

- This figure shows, for example, that header 1 (H1) can only appear (i.e., be built) after piles 1 and 2 appear; in fact header 1 is built around, on top of, and therefore in contact with piles 1 and 2.
- Finally, if the order of appearance of physical elements is to be modeled for all elements, whether or not in contact, a directional arrow such as that shown in the previous figure part c may be necessary.

Activity Description	Duration
Deliver rebars—double-box culvert	10
Move in equipment	3
Deliver rebars—small culverts	10
Set up paving batch plant	8
Order and deliver paving mesh	10
Build and cure double-box culvert, station 38	40
Clear and grub, station 00–58	10
Clear and grub, station 58–116	8
Build small culvert, station 85	14
Move dirt, station 00–58	27
Move part dirt, station 58–116	16
Build small culvert, station 96	14
Cure small culvert, station 85	10
Cure small culvert, station 96	10
Move balance dirt, station 58–116	5
Place subbase, station 00–58	4
Place subbase, station 58–116	4
Order and stockpile paving materials	7
Pave, station 58–116	5
Cure pavement, station 58–116	10
Pave, station 00–58	5
Cure pavement, station 00–58	10
Shoulders, station 00–58	2
Shoulders, station 58–116	2
Guardrail on curves	3
Seeding embankments with grass	4
Move out and open road	3
